

# Deep Water Drilling: Advanced Technologies to Increase Safety, Protect Environment and Reduce Time and Cost.

Eng. Pietro CAVANNA

Italian – Norwegian Energy Dialogue

SOLUTIONS FOR THE FUTURE

Milan, 8th April 2016

# *DW Drilling: Advanced Technologies to Increase Safety, Protect Environment and Reduce Time and Cost*

## WHY DEEP WATER ?

- ❑ Production from mature basins onshore and in shallow water declines, development of DW and UDW reserves has become increasingly vital
- ❑ Oil price decline has intensified pressure on operators, continuous improvement in **safety, operating performance** and **costs** is necessary
- ❑ In this environment, older and less capable assets are more likely to be permanently retired in the next years

# *DW Drilling: Advanced Technologies to Increase Safety, Protect Environment and Reduce Time and Cost*

## EFFICIENCY WILL BE CRUCIAL

- ❑ Need to become more efficient in order to facilitate investments in UDW drilling programs with depressed market prices
- ❑ Improvements required within both drilling performance and HSE issues (workers' safety, energy efficiency, environmental performance)
- ❑ Development of new designs, processes and equipment that will enhance efficiency and provide advanced technological solutions

# *DW Drilling: Advanced Technologies to Increase Safety, Protect Environment and Reduce Time and Cost*

## SAFETY IS PREVENTION, BETTER THAN CURE

Human and environment safety and health protection remains the number 1 priority for the oil and gas industry.

It's important to emphasize that safety requirements are the same in every phase.

*What we do is enough?*

# *DW Drilling: Advanced Technologies to Increase Safety, Protect Environment and Reduce Time and Cost*

## **LESSONS FROM THE PAST**

---

- ❑ Accident is not single cause but a combination of factors.
- ❑ Not single solution but a combination of key factors to avoid accident:

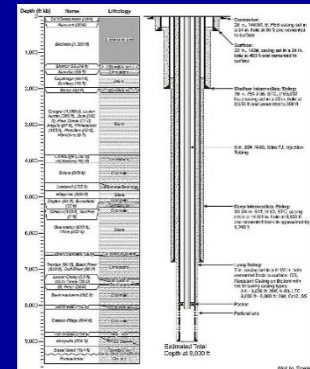

<b>Processes</b>	<ul style="list-style-type: none"><li>➤ <i>Design to ensure safety during all phases</i></li><li>➤ <i>Best practices application</i></li><li>➤ <i>No derogations to Procedures</i></li></ul>
<b>Equipment</b>	<ul style="list-style-type: none"><li>➤ <i>Best available technologies from exploration to production</i></li><li>➤ <i>Development and application of new technologies</i></li></ul>
<b>Strategy</b>	<ul style="list-style-type: none"><li>➤ <i>Strategies focused at HSE QA/QC aspects</i></li><li>➤ <i>Cooperation</i></li></ul>

# DW Drilling: Advanced Technologies to Increase Safety, Protect Environment and Reduce Time and Cost

## DRILLING ACTIVITIES

- ❑ Success in drilling operation start from:
  - Exploration phase (seismic analysis)
  - Well design

- ❑ Respect of some golden rules can make the difference during operations:
  - Ensure the redundancy of safety barriers
  - “One run, one phase”. Do not carry out wiper trips unless strictly necessary
  - ...

# *DW Drilling: Advanced Technologies to Increase Safety, Protect Environment and Reduce Time and Cost*

## **DRILLING ACTIVITIES**

- ❑ Rig staff and heavy machinery operating in the same tight space.

***No personnel on the drill floor and  
“hands-off” operations***

# ***DW Drilling: Advanced Technologies to Increase Safety, Protect Environment and Reduce Time and Cost***

## **DRILLING ACTIVITIES**

---

- ❑ Operating conditions even more challenging as DW & UDW and HP/HT require:
  - *Continuous presence of double barrier on the well*
  - *Continuous and accurate well barriers monitoring*
  
- ❑ A complete drilling package integrated with the drilling rig is necessary to guarantee continuity during drilling phases.

***Discontinuity is one of the main causes of the typical drilling problems, that could be more or less severe depending on the well conditions.***

# *DW Drilling: Advanced Technologies to Increase Safety, Protect Environment and Reduce Time and Cost*

## **A DRILLING ENIGMA**

---

*“Why on earth, for a hundred years, we stopped the circulation of drilling fluids, every time we wanted to make a connection; and disconnected the top drive from the drill string when connection kicks could occur, is an enigma”.*

*“The answer is that we had no reliable means of maintaining circulation until now.*

*Today the enigma could be solved to invest on efficient Continuous Circulation System”.*

# *DW Drilling: Advanced Technologies to Increase Safety, Protect Environment and Reduce Time and Cost*

## **CONCLUSIONS**

---

**25%** of kicks happen during drilling and circulating

**25%** of the time kicks are related to making connections

**50%** of the time kicks are related to tripping the DP in and out of the well

**Source: SPE, JPT August (Shell)**

*Continuity of hydraulic  
barrier  
+  
accurate well barriers  
monitoring*

*Kicks related to making  
connections and tripping phases  
could be avoided*

*Kicks happen during drilling could  
be immediately detected and  
mitigated*

*Thanks for your attention*
